Dom,

I just reviewed the February 19, 2002 monitoring well data from the former Federal-Mogul site (AKA Wagner Lighting and Champion Aviation) Final Report. Although the DEP had no vapor intrusion levels at this time, we had them collect vapor samples from the following locations: one sample from the office and two samples plus a duplicate from the basement. Only 1,1,2-Trichlorotrifluoromethane, Chloroform, Dichlorodifluoromethane, Toluene and TCE were detected, but none exceeded the PELs, TWAs or STELs for these compounds. Also, these detections do not exceed the DEP's current VI screening values. That said groundwater TCE concentrations were detected above the DEP's current nonresidential screening value in wells 2a, 3b, 3c 6a and 6b from 1990-1995, but samples collected from 1996-2001 they were below this value. Attached is a site map for you reference.

Hopes this helps and as always, if you need anything else, please let me know.
